

Let A W Bell Machinery give your RGS machine a face-lift!

Is your RGS grinder starting to show its age? A W Bell have been manufacturing the RGS models for over 20 years and while we provide continued support for all mechanical and hydraulic components, the rapid change in technology makes it difficult to support the electrical sub-systems in these machines.

Obsolete PLC and switchgear components on older models can cause the machine to operate at less than optimum efficiency and in the event of component failure it can put them out of production for weeks or worse yet, permanently. Reduce the risk and at the same time get the benefits of advanced machine control, part storage and increased levels of operator safety with our electrical sub-system refurbishment.

Actual results may vary

## WHAT YOU GET

This refurbishment will completely replace the electrical cabinet on your RGS machine. Together with new safety door switches, distribution boards and rise/fall position transducer, it will bring your tired old machine up to current day standards.

Some of the benefits you will gain:

- Greater machine safety through safety relay monitoring and door interlock switches.
- New motor switchgear to reduce likelihood of failure.
- Touchscreen interface panel allowing easy setup and providing machine error codes and diagnostics.
- Memory storage capability for over 1,000 parts, stored to SD card.
- Rise/fall transducer to allow table height to be programmed and stored to part.
- Modem for remote connection and diagnostics by A W Bell Machinery.
- Distribution boards to simplify out of cabinet wiring.

**Priced from US\$27,000 – US\$30,000**

For less than half the price of a new machine, give your grinder a new lease of life!
